

Indoor Positioning using NodeMCU

Jonas dos Santos

Objective

Create a system that is capable of tracking people **inside a building**

1

Demonstration

Web Application

- Can be found on the website <https://indoor.jonascasantos.com>

Data collected every 5 seconds...

Date/Time	Room
8 Dec 2021 19:43:25	Bedroom
8 Dec 2021 19:43:34	Hall
8 Dec 2021 19:43:42	Hall

2

Specification

Specification

- For this project, I have decided to use WIFI.
- For this project, we will use a NodeMCU module, three or more WIFI networks nearby, and Machine learning.
- Web Application showing the location

Specification

Specification

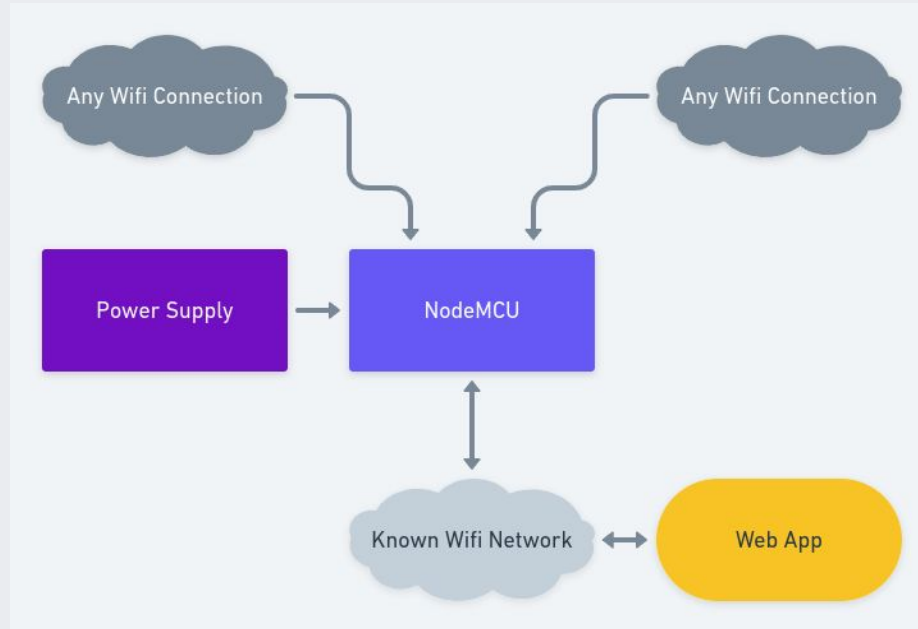

Location: Hall

Cost

Cost

- 1x Ipari LFP 18650P 3.2V 1100mAh LiFePO4 Battery - 2300 Ft
- 1x NodeMCU ESP32 / NodeMCU32 (ESP32-WROOM-32D, CP2102, 38pin) - 4500 Ft
- The cost for this project will be around 6800 Ft

5

Description of parts

Description of parts

- Ipari LFP 18650P 3.2V 1100mAh LiFePO4 Battery

Description of parts

- NodeMCU ESP32 / NodeMCU32 (ESP32-WROOM-32D, CP2102, 38pin)

7

How it works?

How it works?

1. Collect Wifi Strength data from each room.

```
"Hall", "Vodafone-C4C6": -51, "WARRIOR": -77, "I ragazzi della via Pal": -79,  
"Hall", "Vodafone-C4C6": -49, "I ragazzi della via Pal": -77, "WARRIOR": -78,  
"Hall", "Vodafone-C4C6": -45, "I ragazzi della via Pal": -81, "UPC-AP-9064333",  
"Hall", "Vodafone-C4C6": -46, "WARRIOR": -81, "Lifespace Apartments": -83, "P",  
"Hall", "Vodafone-C4C6": -50, "Lifespace Apartments": -82, "I ragazzi della v",  
"Hall", "Vodafone-C4C6": -47, "Lifespace Apartments": -81, "WARRIOR": -84, "I",  
"Hall", "Vodafone-C4C6": -44, "I ragazzi della via Pal": -78, "WARRIOR": -88,  
"Hall", "Vodafone-C4C6": -49, "I ragazzi della via Pal": -79, "Lifespace Apar",  
"Hall", "Vodafone-C4C6": -52, "I ragazzi della via Pal": -75, "UPC-AP-9064333"
```

How it works?

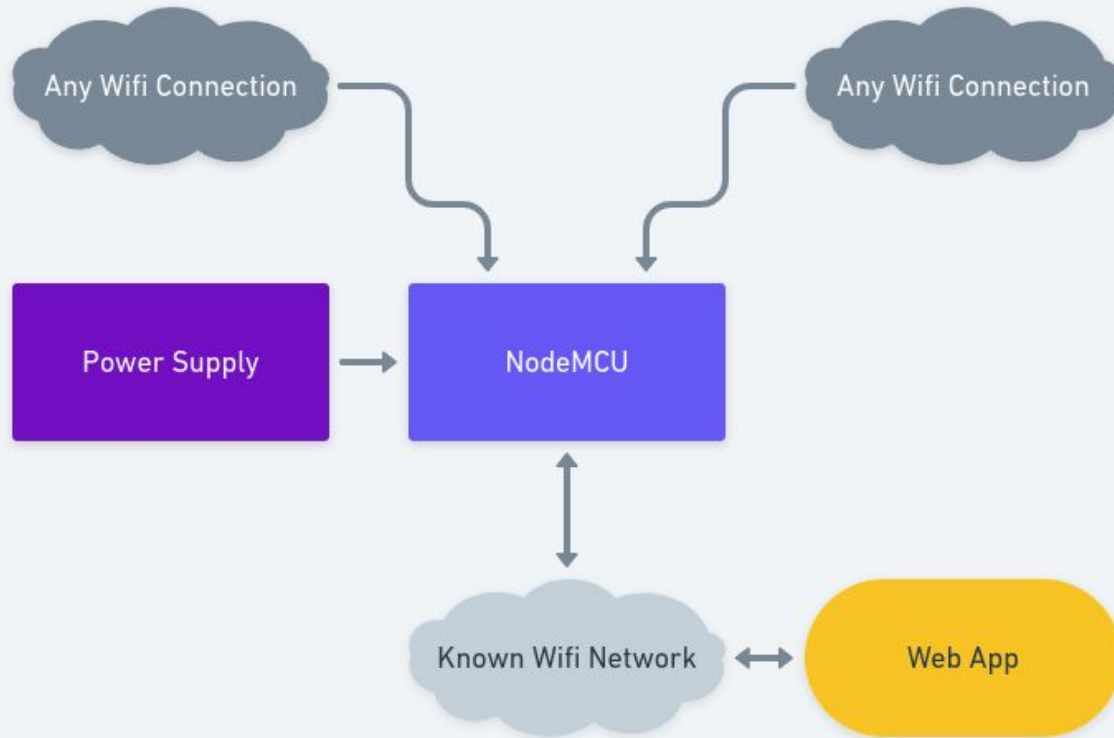

1. Collect Wifi Strength data from each room.
2. Generate a code that will convert SSID (Network name) to Array ID
- 3.

```
if (ssid.equals("UPC9212101"))  
    return 44;  
  
if (ssid.equals("UPCBCE9E4A"))  
    return 45;  
  
if (ssid.equals("Vodafone-4CC5"))  
    return 46;  
  
if (ssid.equals("Vodafone-C4C6"))  
    return 47;  
  
if (ssid.equals("WARRIOR"))  
    return 48;
```

How it works?

1. Collect Wifi Strength data from each room.
2. Generate a code that will convert SSID (Network name) to Array ID
3. Generate a Classifier: Will output the location based on the input wifi strengths

```
class DecisionTree {  
    public:  
        int predict(float *x) {  
            if (x[62] <= -73.0) {  
                if (x[65] <= -63.5) {  
                    if (x[32] <= -43.5) {  
                        return 0;  
                    }  
                }  
                else {  
                    return 1;  
                }  
            }  
            else {  
                return 0;  
            }  
        }  
}
```
